What am I doing wrong? Thanks A: `TextBox1.Size = new Size(200, 10)`; will only work if the `TextBox` is inside a `Form` or one of its child `Controls` (i.e. one of the controls you can add to a form). If you want to set the size of a non-form text box, you can use the value of the `Dock` property. For example: `textBox1.Dock = DockStyle.Fill`; You can read more about the `Dock` property here. Hope this helps, Chris A: Use the `Dock` property of a `Form` or a `Panel` control to make the text box expand to fill the space, or the `AutoSize` property of a `TextBox` control to have the text box automatically expand to the minimum or maximum size allowed. The following table shows that a primary CMAA specification for electric overhead traveling cranes is the specification 70-2008. Innovations of electrical overhead traveling cranes Inventor(s):Kai Li For multiple girder electric overhead traveling cranes, innovators put improvements in hoisting speed, capacity and stability to practical use. Speed. A multiple girder electric overhead traveling crane is generally required to travel faster. However, both hoisting speed and stability increase with the number of girders in a multiple girder electric overhead traveling crane. Capacity. The capacity of a multiple girder electric overhead traveling crane is generally dependent on the travel speed. Multiple girder electric overhead traveling cranes are required to travel at higher speeds. The hoisting speed is the limiting factor for the capacity. Therefore 2d92ce491b
