This program is an easy way to learn, practice and test your vocabulary, and improve your understanding of the Ancient Greek language. I chose to make it as an iPhone app because it is the most platform-independent program on my local devices. (I am running OS X El Capitan.) I chose Java as the programming language to make it. I chose it because I have been familiar with it for some time. I chose Cocoa Touch for the interface because I find it to be the most intuitive for users. I started this project about a year ago. In that time, I have learned more about this programming language, the apple development platform, and the overall process of developing and publishing a mobile app. I have always wanted to develop an app. It seemed like a simple challenge to overcome. After some research, I learned that there are lots of sources to learn from about how to develop an app, especially with the Cocoa Touch framework. I decided to use Cocoa Touch as a means to solving my problem rather than build a completely new application. I began the process of learning the Cocoa Touch framework by watching a few courses on iTunes U that I could not find anywhere else on the internet. I have been using this app for a few months now and have greatly improved my vocabulary with each passing month. To help other people develop, I have created a tutorial that covers the steps for getting the app from creation through publication. I also included a language of my own that I have used to write the tutorial. As a side note, I have been developing in Android for almost 2 years and iOS for almost 1. I have finally decided to put my current knowledge of Android to use and focused most of my attention on this project. I hope that my experience will be helpful for others. UPDATE: I created a solution using CocoaPods. This solution is supported. A: A few comments: You are not using a thread safe language. The alternative approach would be to use a singleton pattern to create the game object. This approach is generally better when there will be only one instance of the game object. You can use a number of singletons in your code. For example: `NSString * const firstLevelKey = @"first`
