## DM-Link Free Download

The program goes through several steps to complete file transfer, as shown in the above screenshots. • Creation of a new file on the sending computer (Default name is "file.txt"). • On the sending computer, create the directory containing the files you wish to transfer. • The source file and directory are copied to the newly created file. • The newly created file is displayed. • The data is sent from the sending computer to the receiving computer. • The received data is displayed. • An optional preview/ abort of the file/ directory to verify the file/ directory is selected. • The option of sending a preview/ abort only is chosen. • The source file is deleted. • The directory is deleted. • The program exits. Important: • The receiving computer needs to be put in Receive Mode (Ctrl-c) • The sending computer needs to be put in Send Mode (Ctrl-s) • DM-Link does not wait for a file or directory to be created before sending the data. You must create these yourself before sending the file/ directory. • The program does not check for a sending file, which means you cannot send anything if there are no files or directories to send. • The program does not check for a file or directory to be deleted before deleting it. It is up to the user to delete these. • The program does not check the CRC of the received file. • The program does not list the files or directories to send to the receiving computer if they do not exist. The user must create these. • To preview a directory, the user must select the directory and choose Action->Preview (Ctrl-P) • To preview a file, the user must select the file and choose Action->Preview (Ctrl-P) • To abort a file, the user must choose Action->Abort (Ctrl-c) • The received file is saved to the destination directory (defined in the receiving computer Setup) and the destination directory is not removed from the receiving computer. • The received file can be overwritten by user specified files on the destination computer. • You cannot delete the destination directory. • When an error occurs, the user is prompted to choose a file (or directory) to abort. If no file is chosen, the program will abort the whole file. • When DM-Link sends a file/ directory, the size of the file is measured in KBytes
